GCP VM Downgrade – Click-by-Click Procedure

VM Name: `db-mypay-01`

GCP Project: `myndsol-prod-project`

Target Configuration: 4 vCPU and 32 GB RAM

Activity: Reduce the VM's CPU and memory resources.

1. Open the GCP Console

1. Log in to the Google Cloud Console using your organization's account.
2. Select the project `myndsol-prod-project` from the project selector at the top.
3. Open the ☰ Navigation menu.
4. Go to **Compute Engine** → **VM instances**.
5. Find `db-mypay-01` and open it.

Important: Make sure the VM name and project match the approved change request.

2. Check the Existing Configuration

Before making any changes, record the following details:

- Current VM status
- Zone
- Machine type

- vCPU and RAM
- Internal and external IP addresses
- Boot disk and additional disks

The expected current configuration is **32 vCPU and 128 GB RAM**. Confirm this in the console.

If the configuration does not match the change request, stop and confirm with the responsible engineer before proceeding.

3. Wait for the Approved Change Window

The requested change window is **3:00 AM**, after the expected payroll processing period of 2:00–2:30 AM.

Do not perform the downgrade before the approved window. At the scheduled time, confirm with the responsible team that payroll processing has completed and the VM can be stopped.

4. Stop the VM

1. Return to **Compute Engine** → **VM instances**.
2. Select `db-mypay-01`.
3. Click **STOP**.
4. Confirm the action if prompted.
5. Wait until the VM status changes to **Terminated**.

Warning: The VM will be unavailable while stopped. Do not select Delete or Reset.

5. Edit the Machine Configuration

1. Open `db-mypay-01`.
2. Click **EDIT**.
3. Find the **Machine configuration** section.
4. Select a machine type that supports the approved target of **4 vCPU and 32 GB RAM**.

Do not assume that a custom machine type is available for every machine series. If the required CPU and memory combination is unavailable, stop and confirm the supported machine type with the responsible engineer.

5. Do not change disks, networking, service accounts, or other settings unless specifically approved.
6. Click **SAVE**.
7. Wait for the configuration update to complete.

6. Verify the New Configuration

Open the VM details page and confirm:

- vCPU: 4
- Memory: 32 GB
- VM name: `db-mypay-01`
- Project: `myndsol-prod-project`

If the configuration is incorrect, do not start the VM until the issue has been reviewed.

7. Start the VM

1. Go to **Compute Engine → VM instances**.
2. Select `db-mypay-01`.

3. Click **START / RESUME**.
4. Wait until the status shows **Running**.

8. Perform Post-Change Validation

After the VM starts, verify:

- The VM status is **Running**.
- The machine configuration is 4 vCPU and 32 GB RAM.
- The server is reachable using the normal approved access method.
- The database/application is healthy.
- The responsible application team confirms that the required services are working.

If the VM fails to start or the database/application is unhealthy, inform the responsible engineer immediately and follow the approved incident or rollback procedure. Do not make unapproved changes.

Final Workflow

Select project → Open VM → Record current settings → Wait for approved window → Confirm payroll completion → Stop VM → Wait for Terminated → Edit machine configuration → Save → Verify 4 vCPU / 32 GB RAM → Start VM → Validate server and application health.

Important: This is a production VM downgrade. Obtain the required approval, confirm the maintenance window, and ensure the rollback plan is available before starting the activity.
